

The number on the left is the slide. Talk like you're telling a friend. You don't need to read it word for word.

- 1 Hi everyone! We're Team Webnest, and this is FraudLens. We built it to stop scam payments before the money is gone.
- 2 Let me start with a quick story. Someone gets a call: "Hello, I'm from upay, there's a problem with your account." Or: "You won a lottery, just pay a small fee." They get scared, and they send the money. From their own phone, with their own PIN. So for the system, nothing looks wrong. The money goes to a fake account, and in a few minutes it's gone.
- 3 Today, most checks only look at the person sending the money. But here, that person is the victim, not the scammer. That's why these scams slip through. The old rules pick the right one about 1 time in 8. Ours gets it right about 8 times in 10.
- 4 So we flipped the question. We don't ask "who is sending?" We ask "where is this money going?" And if it looks like a scam, we stop it in the gentlest way we can.
- 5 Here's what the user sees. You press send, and in a blink, FraudLens checks it. Most payments go through like normal. If something feels off, you get a warning in Bangla before the money leaves. If it's worse, you confirm again and wait 30 minutes. And if it's really risky, a real person looks at it first.
- 6 We also keep an eye on the accounts that receive the money. Scammers use the same accounts again and again. In our tests, we caught 70 of them before even one victim had paid.
- 7 Now the numbers. We caught about 87 out of every 100 scams. Only 1 in 200 normal users got bothered. And we saved about 97 percent of the victims' money.
- 8 Compared to the old rule-based way, we're about 11 times better at finding the risky payments.
- 9 A quick look at how we built it. The smart part is written in Python. There's a backend that answers in milliseconds, and a web dashboard on top. The whole thing starts with one command, and it's covered by more than 200 tests.
- 10 And yes, it really works. This is our dashboard. The fraud team sees alerts as they happen, opens a case, and can freeze a scam account. We'll show you right after this.
- 11 So why FraudLens? It follows the money. It talks to people in their own language. It tells you why it flagged something. And a human always makes the final call. It even caught a kind of scam it had never seen before.
- 12 One honest note: our data is simulated for now. Next, we want to test it on real upay payments. That's FraudLens. Thank you! We're happy to answer your questions.
